

Employee Attrition Prediction - Preprocessing Report

1. Dataset Overview

The IBM HR Analytics Employee Attrition dataset contains 1470 employee records and 35 columns. The target variable is Attrition, which indicates whether an employee left the organization.

2. Data Quality Checks

The dataset was checked for missing values and duplicate records. No missing values and no duplicate rows were found.

3. Data Cleaning

Duplicate rows and missing rows were removed during the final cleaning step. The cleaned dataset contains 1470 rows and 35 columns.

4. Encoding

Categorical variables were processed using OneHotEncoder with `handle_unknown='ignore'`. This allows the pipeline to handle previously unseen categorical values.

5. Scaling

Numerical variables were standardized using StandardScaler so that numerical features are placed on comparable scales.

Numerical variables were standardized using StandardScaler so that numerical features are placed on comparable scales.
